HYACINTH BULBS FROM HOLLAND

Hyacinths are a most dependable source of color and fragrance both in the garden in the early spring, and indoors during the winter. No other bulb is more easily grown to perfection in bloom. Plant out-of-doors in clumps of three, six or twelve. Set 8 inches apart and cover with 4 inches of soil. Don't mix fertilizer with the soil. Spread it on top after you have the bulbs covered.

GROWING HYACINTHS IN PURE WATER

Unpack the bulbs when you get them and place them in a cool, dry, dark place until December 1st. Before placing them in the Hyacinth glass clean the root base and plate of the bulbs so that all remains of the old roots and root plate are removed. Fill the glasses with clean, cool water until the root base of the bulbs are touched. Place the glasses in cool, dark closet or cellar until the top growth is 4 inches above the bulb. Best temperature 50 degrees. When a 4-inch top growth has been made, take the glasses to a window in a warm room and add water if necessary. If the air in the room is dry, moisten the flower buds each day with a wad of cotton, dipped in cool water.

BOTANICAL TULIPS

These are the wild species, most of them natives of Central Asia. The brightly colored flowers often come with petals that are pointed, twisted and reflexed. In the rock garden these flowers are seen to best advantage. They are a most interesting class of Tulips.

KAUFMANNIANA. Creamy white flowers, more or less tinged with rosy red on the outside of the petals. Unusual in form. Often called the Water Lily Tulip. Grows 6 inches high and blooms very early in the spring.

Here Is the Way We Plant Tulip Bulbs

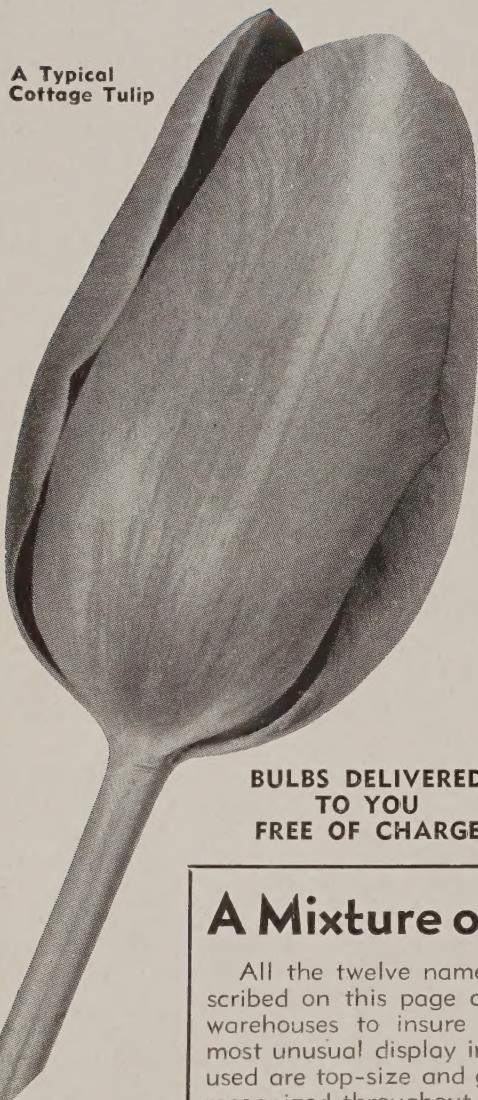

Bone meal is spread on the ground where the bulbs are to be planted, using 10 pounds to each 100 square feet (10 x 10). The earth is then spaded to a depth of 12 inches, firmed down and raked smooth. The bulbs are then placed on top of the ground, about 6 inches apart, at the spot where they are to be planted. (Better effects are obtained where at least 6 bulbs of a variety are planted together. We keep them in groups of 25 to 50 of a kind.) A trowel digs out a hole 6 inches deep in which the bulb is set and the hole filled in with earth. The important item of food for the bulb comes next. Tulips, Hyacinths, Narcissus, etc., make their roots right after they are set out in the fall. Large blooms come from bulbs that have large root growth, and large root growth comes from proper feeding. Any complete plant food is good, spreading it on the ground after the bulbs have all been set, using 5 lbs. to each 100 square feet. We finish up with a smooth raking for it will be too late to do this in the spring when the Tulips are breaking through the ground.

Narcissus - Daffodils

Narcissus and Daffodils are very easy to grow in the garden, for they thrive in any good soil and in just about any location. Plant them in clumps of six to a dozen bulbs among the perennial plants and in the foreground of shrubbery and evergreens. Planted in large masses through woodlands and along hillsides and in meadows, they give a most pleasing effect. They will increase in beauty and number without any special care and soon become permanently established. Plant Narcissus bulbs about 4 inches deep and 6 inches apart and get them into the ground as early in the fall as possible.

PLANTING TABLE FOR PLANTS AND BULBS

Planting: The table below shows the number of plants or bulbs required to fill a circular bed of the dimensions given. In planting, begin at outside row—where 6 inches apart, 3 inches from edge of bed; where 12 inches apart, 6 inches from edge of bed. It is customary among professionals in planting a bed to set the plants or bulbs somewhat closer together in the two outer rows, giving more space between each plant or bulb toward the center of the bed.

A square bed will take about the same number of plants. For an oval bed, add length and breadth and divide by 2. For example, an oval 9 ft. long by 7 ft. wide will require the same number of plants as a circular bed 8 ft. in diameter.

Diameter of Bed	6 Inches Apart	12 Inches Apart	18 Inches Apart	Diameter of Bed	6 Inches Apart	12 Inches Apart	18 Inches Apart

NATURALIZING DAFFODILS

One of the finest things that can be done with a piece of open, waste land is to plant it broadcast with hundreds of Daffodil bulbs. While they will not endure complete shade, any open, semi-shaded area will suit them, and they will riot with the utmost freedom in a sloping meadow, particularly at the sides of streams or small lakes.

When Daffodils are to be naturalized, they should not be planted in regular rows or at even distances apart. The best thing is to carry a basket of bulbs over the ground, spilling them irregularly and planting the bulbs where they fall. It will take several years to achieve the full value of a naturalistic planting, and the Daffodils should be left entirely undis-

turbed during that period. The foliage should never be cut off, but allowed to ripen and wither away naturally.

A Mixture of Narcissus and Daffodils for Naturalizing

An excellent mixture of the varieties in all the classes of Narcissus and Daffodils described here. A planting of this mixture may show you some varieties you do not now know and may want in larger quantities in your garden. \$1.50 for 12; \$2.85 for 25; \$10.75 for 100, prepaid to you.

HIGHLAND PARK GRASS SEED

99.90% Weed Free

This mixture has proved its worth by producing beautiful and permanent lawns for the city home, country estate, and public park. It is a careful blending of outstanding recleaned turf-making grasses including bent grass and the famous English clover. It has proved its quality not only on the smaller lawn of the city and suburban home, but has been and is being used with splendid results in many of the city parks, cemeteries, and large estates. Professional landscape gardeners specify that they will use Highland Park Grass Seed when submitting plans to particular patrons. The name "Highland Park" is a symbol of quality.
